

Minimal Invoice

This invoice template features a clean minimalist layout with plenty of whitespace. Despite this, it contains extensive information and can stretch across pages automatically if required.

Description

This invoice template features a clean minimalist layout with plenty of whitespace between important invoice elements. Starting from the top, the main title can be changed to a formal quotation or receipt and the date is optional. The next major block shows invoice and project information on the left and the invoice payee (the person or company who needs to pay the invoice) on the right. This is followed by the invoice items table and then the optional Terms text below. Finally, three

Invoice Settings Commands

Several important invoice settings commands need to be set in the INVOICE SETTINGS block at the top of the template.

`\taxrate{}` This command sets the tax rate to use for automatically calculating tax. Do one of the following:

1) Leave command empty (i.e.

`\taxrate{}`) for no tax and no before tax and total tax lines at the bottom of the invoice. 2) Enter 0 (i.e.

`\taxrate{0}`) for no tax but before tax and total tax lines explicitly saying 0% tax are output at the bottom of the invoice. 3) Enter a whole number (with or without a decimal) to calculate tax and output before tax and total tax lines at the bottom of the invoice, e.g.

`\taxrate{10}` = 10% tax and

`\taxrate{15.5}` = 15.5% tax.

`\currencycode{}` This command sets the three-letter currency code, which is shown on the TOTAL line of the

LaTeX Templates

Template Categories

What Is LaTeX?

invoices or domestic invoices where the currency differs from the domestic

Newest Templates

LaTeX Typesetting Service

currency. Do one of the following: 1) Enter a 3 letter code to have it appear at the bottom of the invoice. 2) Leave the command empty (i.e.

`\currencycode{ }`) if you don't want the code to appear on the invoice.

`\invoicenumber{ }` This command specifies the invoice number, shown in a large font near the top of the invoice.

You can either: 1) Enter an invoice number, it may include any text you'd like such as `\invoicenumber{13-A}` . 2) Leave command empty (i.e.

`\invoicenumber{ }`) and no invoice number will be output in the invoice.

`\determinecurrencysymbol{ }`

This command allows you to automatically change the currency symbol used in the invoice. By default, the invoice uses dollars and this command is commented, but you can uncomment it and specify one of the following to automatically change the symbol to the one for the currency: GBP, CNY, JPY, EUR, BRL or INR. If your currency is different from those, you can also uncomment the line

`\renewcommand{\currencysymbol}`

Advanced Invoice Settings

[Newest Templates](#)[LaTeX Typesetting Service](#)`\roundcurrencytodecimals`

The number of decimals to round currency numbers. This defaults to 2 decimal places but if your invoice costs are all whole numbers you can set this to 0 so there are no decimals.

`\roundquantitytodecimals`

The number of decimals to round quantity numbers. This defaults to 2 decimal places but if your invoice hourly rates or item prices are all whole numbers you can set this to 0 so there are no decimals.

`\currencysuffix`

Specify a suffix for currency numbers. This is useful because some currencies output the currency symbol after the number, such as Sweden's krona specified with a 'kr' suffix. Leave this command empty for no suffix.

`\sisetup{group-minimum-digits=4}`

The number of digits for which to start delimiting numbers into groups. For example, if this is set to the default 4, once a number reaches 1000, it will be output as 1,000.

number groups. This is typically a comma, but a space is used in some European countries.

Newest Templates

LaTeX Typesetting Service

`\sisetup{output-decimal-marker={.}}` Character to use for separating the decimals. This is typically a period, but a comma is used in some European countries.

Invoice Element Commands

Several custom commands are present in the template for outputting various elements of the invoice.

`\outputheader{}{}` This command takes 2 parameters and outputs the top two lines of the invoice containing the document title (Invoice by default) and the date. This is useful if you want to use this template for a formal quotation or receipt instead of an invoice. The date parameter can be left empty if no date is required.

`\duedatedays{ }` Within the invoice information section you will find this command to automatically determine the date when the invoice is due using the number of days from today. Simply enter a whole number for the number of

determined and output automatically.
 For example, enter 7 for the invoice to be
 due in 1 week, and the date 7 days from
 now will be output.

Newest Templates

LaTeX Typesetting Service

`\invoiceconditions{}` This
 command is used for specifying invoice
 conditions, terms, guarantees, etc. Enter
 text and break it into multiple
 paragraphs with `\\` if required.
 Leave the command empty (i.e.
`\invoiceconditions{}`) if not
 required.

Populating the Invoice Table

The invoice table is output with a
`invoicetable` environment. This
 automatically creates the header line
 with column descriptions and footer
 lines with totals. Within the
 environment, you need to use the
`\invoiceitem{}{}{}{}` command
 for adding invoice items. This command
 calculates the invoice item subtotal,
 automatically adds it to the running
 total for the whole invoice and outputs
 the invoice item information and total as
 a table row. It requires 4 parameters as
 described below:

LaTeX Templates

Template Categories

What Is LaTeX?

span too many lines.

2. Item quantity (or hours); this should be a positive number (with no commas or other symbols) and decimals are allowed.
3. Item unit price (or hourly rate); this should be a positive or negative number (with no commas or other symbols) and decimals are allowed.
4. Item note; this can be left empty but, if used, it should be kept very short.

Invoice Information Sections

Various invoice information, such as your company address, payment information, payee address, and more, are output across multiple lines in blocks. These blocks are housed in `minipage` environments with fixed widths. Adjust the width if you have content that requires more space but make sure to adjust the widths of nearby boxes to compensate.
