

Wile E. Invoice

This invoice template is for businesses or contractors who need to request payments from customers or clients. It features a clean simple layout with a company name at the top, then a section for the recipient's contact information, then a section for invoice information, then the invoice items, then a terms and conditions and amount due section and finally a sender's contact information section. The invoice is created using a series of custom commands that make populating all the information very easy. All invoice numbers for subtotals, gross, tax and net are calculated automatically using a provided tax rate and item quantities and rates.

Usage Guide

where the information shown varies widely based on application. For example, an invoice for hourly work will differ from an invoice for goods to be delivered. The template is extensively commented to allow you to modify it to suit your application. All logic for the layout is housed in `structure.tex` and should be modified there. Once you have modified `structure.tex` to your liking, you can simply duplicate `main.tex` for each new invoice while keeping `structure.tex` the same.

Compilation

This template should be compiled with standard `pdflatex`.

Custom Environments

The `invoice` environment should span the entire invoice and outputs the invoice sections in correct order to either side of the invoice items with a defined spacing between them. Invoice items are housed in a `invoicetable` environment which creates the table of invoice items and automatically calculates the gross, tax and net totals.

using custom commands in `main.tex`.
Commands are self explanatory, e.g.

`\payeeName` houses the name of the payee/recipient and its value is automatically placed in the correct location in the invoice. Generally, all commands must have content as the invoice outputs them with defined headings and/or locations. If you find that you don't need one or more of them, you will need to go into `structure.tex` and modify the invoice layout to remove the unneeded information.

The only command that is used multiple times (exclusively within the

`invoicetable` environment) is the `\invoiceitem` command. This command takes 3 mandatory arguments for: `\invoiceitem{Description}{Quantity (number)}{Rate (number)}`. Both the item quantity and rate can be numbers with decimals, e.g. quantity of 1.5 (hours) at a rate of 125.50 (dollars per hour).

The `\taxrate` command should contain a number between 0 and 1 for the tax rate to use for the invoice. For example, a goods and services tax of

applied, use a value of 0. The template includes some commented code for how to automatically display the specified tax rate on each invoice as a whole percentage (e.g. "Tax (12.5%)").
