

University/School Laboratory Report

This template is useful for students or technical staff to formally report on the results of a laboratory experiment. The structure follows the typical flow of information required in a laboratory report: the objective of the experiment, methods, data gathered, results and discussion.

Description

A laboratory report is used as a formal report of the objectives and results of a laboratory experiment. This template is primarily for students at a school or university to document laboratory experiments, but it can also be used by academic or technical staff at

What Is LaTeX?

required in a laboratory report: the objective of the experiment, methods, data gathered, results and discussion. A bibliography is included at the end and examples of referencing are provided, as this is often required in a report of this nature.

The template contains an example chemistry experiment and notation. It uses several technical packages to output scientific units, chemical reactions and equations. It is recommended to familiarize yourself with these packages when writing your report, and to add additional packages for your field if required.

Determination of the Atomic Weight of Magnesium

CHEM 101

Michael SLACKENERNY

March 21, 2022

Date Performed: February 13, 2022

Partners: Cecilia SMITH

Tajel KHUMALO

Instructor: Professor RIVERA

1 Objective

To determine the atomic weight of magnesium via its reaction with oxygen and to study the stoichiometry of the reaction (as defined in 1.1):

$$2\text{Mg} + \text{O}_2 \longrightarrow 2\text{MgO}$$

1.1 Definitions

Stoichiometry The relationship between the relative quantities of substances taking part in a reaction or forming a compound, typically a ratio of whole integers.

Atomic mass The mass of an atom of a chemical element expressed in atomic mass units. It is approximately equivalent to the number of protons and neutrons in the atom (the mass number) or to the average number allowing for the relative abundances of different isotopes.

2 Experimental Data

Mass of empty crucible	7.28 g
Mass of crucible and magnesium before heating	8.59 g
Mass of crucible and magnesium oxide after heating	9.46 g
Balance used	#4
Magnesium from sample bottle	#1

Usage Guide

Compilation

This template should be compiled with standard pdf_latex. There are no special requirements outside of packages that are supplied with a full distribution of TeX. The template features a bibliography which needs to be compiled separately using biber. Your editor should have an option to use the biber engine and you can also compile from the command line by navigating to the template directory and compiling with `biber template`.

Scientific Notation

The template uses a chemistry experiment as example content and, as such, typesets a chemical equation using the `\ce` command from the mhchem package. [See the package documentation](#) for more information about this command and how to typeset chemical reactions in general.

Scientific units in the template are typeset using the `\SI` command
