

Journal Article

This article template aims to emulate scientific journal publications with a formal conservative style and a two-column layout for text. Extensive examples of common content found in scientific papers are provided.

Description

This article template aims to emulate scientific journal publications with its two column formal layout. Margins are intentionally small to fit more content onto each page, with column widths at optimal length for reading so eyes do not become strained. The template features common document elements found in scientific articles, including: an author/affiliation list, abstract, tables and figures within single columns, tables and figures spanning both columns and

Usage Guide

Compilation

This template should be compiled with standard pdflatex. There are no special requirements outside of packages that are supplied with a full distribution of TeX. The template features a bibliography which needs to be compiled separately using biber. Your editor should have an option to use the biber engine and you can also compile from the command line by navigating to the template directory and compiling with `biber template`.

Class Options

The `unnumberedsections` class option is enabled by default, and if you want your sections and subsections to be numbered (e.g. 1.2 Section Name), you should comment this option.

Headers and Footers

head is set in the `\runninghead` command and usually contains a shortened running title for the paper, although this line could also include journal information or a shortened author list. The footer text is set using the `\footertext` command and contains journal information in the template, but you may wish to use it for something else. Both commands should be left empty if not desired, rather than commented out. Both headers and footers alternate their positions between odd and even pages, typical of a printed document. If you would like to stop this behavior, simply comment out the `twoside` class option.
