The templates provided here include instructions for how to use them and examples of all the common elements that are required in journal/conference submissions. The templates are extensively commented and sectioned to make writing your manuscript easy. Make sure to read the text in the template as this contains important information for the way in which you should fill out the template.

The ACM currently publishes the following journals:

Journal of Engineering for Gas Turbines and Power, Journal of Mechanical Design, Journal of Turbomachinery, Journal of Vibration and Acoustics, Journal of Pressure Vessel Technology, Journal of Manufacturing Science and Engineering, Journal of Dynamic Systems, Measurement & Control, Journal of Applied Mechanics, Journal of Heat Transfer, Journal of Mechanisms

This is the abstract. This article illustrates preparation of ASME paper using $\text{\LaTeX}$. An abstract for an ASME paper should be less than 150 words and is normally in italics. Please use this template to test how your figures will look on the printed journal page of the Journal of Mechanical Design. The Journal will no longer publish papers that contain errors in figure resolution. These usually consist of unreadable or fuzzy text, and pixilation or rasterization of lines. This template identifies the specifications used by JMD some of which may not be easily duplicated; for example, ASME actually uses Helvetica Condensed Bold, but this is not generally available so for the purpose of this exercise Helvetica is adequate. However, reproduction of the journal page is not the goal, instead this exercise is to verify the quality of your figures. Notice that this abstract is to be set in 9pt Times Italic, single spaced and right justified.

Nomenclature

A You may include nomenclature here.

α There are two arguments for each entry of the nomenclature environment, the symbol and the definition.

The primary text heading is boldface and flushed left with the left margin. The spacing between the text and the

heading is two line spaces.

1 Introduction

This article illustrates preparation of ASME paper using $\text{\LaTeX}$. The $\text{\LaTeX}$ macro `asme2ej.cls` style file `asme2ej.bst`, and the template `asme2ej.tex` that create this article are available on the V URL address <http://iel.ucdavis.edu>. ensure compliance with the 2003 ASME MS4 lines [1], you should modify neither the `asme2ej.cls` nor the `asme2ej.bst` style file `asme2ej.tex`. By comparing the output generated by typesetting the `asme2ej.tex` source file, you should find evidence to help you through the preparation of ASME paper using $\text{\LaTeX}$. Details on using $\text{\LaTeX}$ can be found in [2].

In order to get started in generating a two column version of your paper, please format the document margins. Break the text into two sections one for the heading, and another for the body of the paper.

The format of the heading is not critical, but the format of the body of the text is critical. This will allow you to see that the margins are matched to the column width and font size. The double column of the heading section is set to the first column, a 0.5in spacing, and 4.5in for the body of the paper, set it to 3.5in.

*Address all correspondence related to ASME style format and figures to this author.

†Address all correspondence for other issues to this author.

Authorship

The template provided here was created and is owned by the ASME. It is an unmodified version of that found on the
