

Cleese Assignment

This template comes in two versions, one for teachers/instructors/educators to create assignments/homework for their students to fill out by hand, and another for students proficient in LaTeX to answer questions posed to them at school or university/college. Both versions contain simple environments for each question and subquestion within, and allow answer boxes to be created with either an answer or blank for space to write an answer. Sets of questions can be grouped by headings and the template includes examples of including an image, table, equation and code within questions.

Description

This template comes in two versions, one for teachers/instructors/educators to create assignments/homework for

to answer questions posed to them at school or university/college. Both versions contain simple environments for each question and subquestion within, and allow answer boxes to be created with either an answer or blank for space to write an answer. Sets of questions can be grouped by headings and the template includes examples of including an image, table, equation and code within questions.

The students version of the template contains a title page for handing in the assignment and headers on each page list the class, assignment title, class instructor and student name, so if any page gets lost it can be easily attributed to the correct student later. The teachers version of the template does not have a title page as it is meant to be distributed to students individually on paper and lists the class, assignment title, class instructor and due date in the headers on each page.

What Is LaTeX?

What is the airspeed velocity of an unladen swallow?

While this question leaves out the crucial element of the geographic origin of the swallow, according to Jonathan Corum, an unladen European swallow maintains a cruising airspeed velocity of **11 metres per second**, or **24 miles an hour**. The velocity of the corresponding African swallows requires further research as kinematic data is severely lacking for these species.

Question 2

How much wood would a woodchuck chuck if a woodchuck could chuck wood?

(a) Suppose "chuck" implies throwing.

According to the Associated Press (1988), a New York Fish and Wildlife technician named Richard Thomas calculated the volume of dirt in a typical 25–30 foot (7.6–9.1 m) long woodchuck burrow and had determined that if the woodchuck had moved an equivalent volume of wood, it could move "about **700 pounds (320 kg)** on a good day, with the wind at his back".

(b) Suppose "chuck" implies vomiting.

A woodchuck can ingest 361.92 cm^3 (22.09 cu in) of wood per day. Assuming immediate expulsion on ingestion with a 5% retainment rate, a woodchuck could chuck **343.82 cm^3** of wood per day.

Question 3

Identify the author of Equation 1 below and briefly describe it in English.

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)} \quad (1)$$

Question 3 continued on next page...

Custom Environments

There are two custom environments you need to use in this template, the

`question` environment and the

`subquestion` environment. Each

question in the assignment should be in its own `question` environment and any subquestions should be placed in

`subquestion` environments within.

The `question` environment outputs a “Question 1” heading and the number iterates automatically for each new environment. `subquestion`

environments have one argument which is the subquestion question, and each of these is output as “(a) Question...” where the letter is automatically iterated for each `subquestion` environment.

Custom Commands

A few custom commands are available to be used within the

`question` / `subquestion`

environments.

`\questiontext{[text]}` is used

to output a question within the

`question` environment. It should

required (e.g. you may have a question that is entirely within a figure).

LaTeX Typesetting Service

`\answerbox{[num lines]}` is used primarily in the For Teachers version of the template to output an answer box with a height of the number of lines supplied to the single required parameter. It will break across pages automatically. `\answer{[answer text]}` is used primarily in the For Students version of the template to answer a question or subquestion. It will expand to fill whatever content is put into it and will break across pages automatically. Finally,

`\assignmentSection{[section title]}` can be used in either template outside any `question` environment. It outputs an all-caps header with 2 rules on either side to act as a section title for the questions following it. It's useful to group questions that are of a similar nature together.
