The front matter of the template includes a title page, copyright page, quote/dedication page, preface, table of contents and lists of tables and figures. Each is populated with example content to get you started and can be removed easily if it is not needed. The back matter of the template includes an appendix, bibliography, notation (a.k.a. nomenclature), greek letters example table, glossary and index. These can be moved to the front matter or removed easily and are provided as examples if these features are required.

The template body includes numerous examples of how to make use of the large margin for all kinds of content. The main text column contains examples of colored boxes, lists, code listings, figures, tables, equations, referencing, theorems and more, to serve as a

The chapters in the template first expertly describe the logic and structure of the template, then move on to detailed explanations of each available document element with examples and descriptions for how to use and modify them. **It's important to read this information carefully if you are going to write a substantial work using the template, this template is not for LaTeX beginners and requires some LaTeX knowledge to make full use of it.**

1.1 The Main Ideas

Many modern printed textbooks have adopted a layout with prominent margins where small figures, tables, remarks and just about everything else can be displayed. Arguably, this layout helps to organise the discussion by separating the main text from the ancillary material, which at the same time is very close to the point in the text where it is referenced.

This document does not aim to be an apology of wide margins, for there are many better suited authors for this task; the purpose of all these words is just to fill the space so that the reader can see how a book written with the kaobook class looks like. Meanwhile, I shall also try to illustrate the features of the class.

The main ideas behind kaobook come from this [blog post](#), and actually the name of the class is dedicated to the author of the post, Ken Arroyo Ohori, which has kindly allowed me to create a class based on his thesis. Therefore, if you want to know more reasons to prefer a 1.5-column layout for your books, be sure to read his blog post.

Another source of inspiration, as you may have noticed, is the [Tufte-Latex Class](#). The fact that the design is similar is due to the fact that it is very difficult to improve something which is already so good. However, I like to think that this class is more flexible than Tufte-Latex. For instance, I have tried to use only standard packages and to implement as little as possible from scratch¹; therefore, it should be pretty easy to customise anything, provided that you read the documentation of the package that provides that feature.

In this book I shall illustrate the main features of the class and provide information about how to use and change things. Let us get started.

1.2 What This Class Does

The kaobook class focuses more about the document structure than about the style. Indeed, it is a well-known L^AT_EX principle that structure and style should be separated as much as possible (see also Section Section 1.3 on the following page). This means that this class will only provide commands, environments and in general, the opportunity to do things, which the user may or may not use. Actually, some stylistic matters are embedded in the class, but the user is able to customise them with ease.

The main features are the following:

Page Layout

The text width is reduced to improve readability and make space for the margins, where any sort of elements can be displayed.

Chapter Headings

As opposed to Tufte-Latex, we provide a variety of chapter headings among which to choose; examples will be seen in later chapters.

Usage Guide

Compilation

This template compiles with standard pdf_latex. However, you will need to compile the bibliography, index and glossary separately to the template itself. It's best to compile in a specific order so that the document correctly updates these elements in turn. To facilitate this, a compileall.sh file is provided with the template which you can run from the command line after navigating to the template directory. This file runs the correct sequence of commands to compile the document, assuming you do not change the filename of the template from main.tex.

LaTeX Templates

Template Categories

What Is LaTeX?

you will need to run from the command line or your LaTeX editor:

Newest Templates

LaTeX Typesetting Service

```
pdflatex main # Compile template
makeindex main.nlo -s nomencl.ist
makeindex main # Compile index
biber main # Compile bibliography
pdflatex main # Compile template
makeglossaries main # Compile glossary
pdflatex main # Compile template
```
